Expenses fraud and health screening: Some interesting mathematics of everyday things.

Dave Cohen

A talk about how the well-thumbed pages at the beginning of log tables allowed fraud investigators to convict New York officials who were cheating on their expenses.

You will understand why health screening programmes necessarily lead to many more false positives than true diagnoses.

This mathematics will be explained using simple hands on activities and even a games show. No previous maths is required.

An informal evening at the Bridge Patisserie to listen to Dave talk, share a coffee and join in with discussion and questions.

Entry is free, though donations to the cost of running a Café scientifique are welcome.
